AI Tooling Disclosure

Tool used

The development of this project's source code was assisted by **Claude Code**.

Division of labor

We owned the parts of the project that involve thinking: the database design, the system requirements, every structural decision about how the data is modeled, and the visual/UX direction. Claude was used mainly to write the *code* that implements those decisions.

In particular, **the database side of the project was primarily our work**. We designed the ER model in Lucid, decided what columns and relationships should exist, chose which deletes should cascade vs restrict, and decided when to add new columns (e.g. `birthday` alongside `approx_age`, `image_url` for photo uploads) as new features came up. Claude's role on the database side was to review the schema and suggest fixes when issues came up during the build, and to write the migration SQL we decided on.

What AI helped with

At a high level, Claude was used for:

- **Scaffolding the application:** initial Next.js project setup, configuration for the ORM and the deployment, env-var wiring, and CLI provisioning steps that are tedious but mechanical.
- **Writing UI components** from team-provided layouts and feature descriptions. We described what each page should do; Claude produced the React/Tailwind components, which we then reviewed.
- **Writing query and Server Action code** to back our specified requirements. Claude translated “we need a page that shows overdue plants” into actual SQL/Drizzle code; we reviewed for correctness.
- **Iterating on features** we requested during the build: the retro visual overhaul, separating Location and Room as independent attributes, the inline-create flow on the Add Plant form, the photo upload, and so on. Each was driven by team direction.
- **Debugging production and git issues**, most notably a 504-timeout problem caused by schema-lock contention on cold function starts. Claude analyzed the logs, proposed a hypothesis, and we confirmed and approved the fix.
- **L^AT_EX scaffolds of the deliverable docs** which we completed.

Where human intervention was required

- **Database design end-to-end** was our domain. Every column, relationship, and constraint in `schema.pdf` reflects our design, not Claude's.
- **Requirements interpretation:** the milestone-1 requirements PDF was given to Claude as a fixed spec; bonus features (calendar view, search, photo upload, retro UI) were our requested additions, not Claude-initiated.
- **Account-bound operations** Supabase project management, Vercel deploys, and Lucid diagram editing were all done by us.
- **The schema diagram** was produced in Lucid by us. Claude only suggested specific edits for us to apply.
- **The reflection document** was written by us using a $\text{\LaTeX}$ template that Claude generated; the writing was done without AI assistance.

Statement

All AI-generated code was reviewed by at least one team member before being committed. The team is collectively responsible for the project's design, correctness, and academic integrity.
